

## Advanced Options VirtualBox

Here are some tips in the advanced settings of your new Kali Linux virtual machine. I will share these with you to help you get better performance out of your VM

1. First you want to click on the machine you create and then click on the settings gear icon

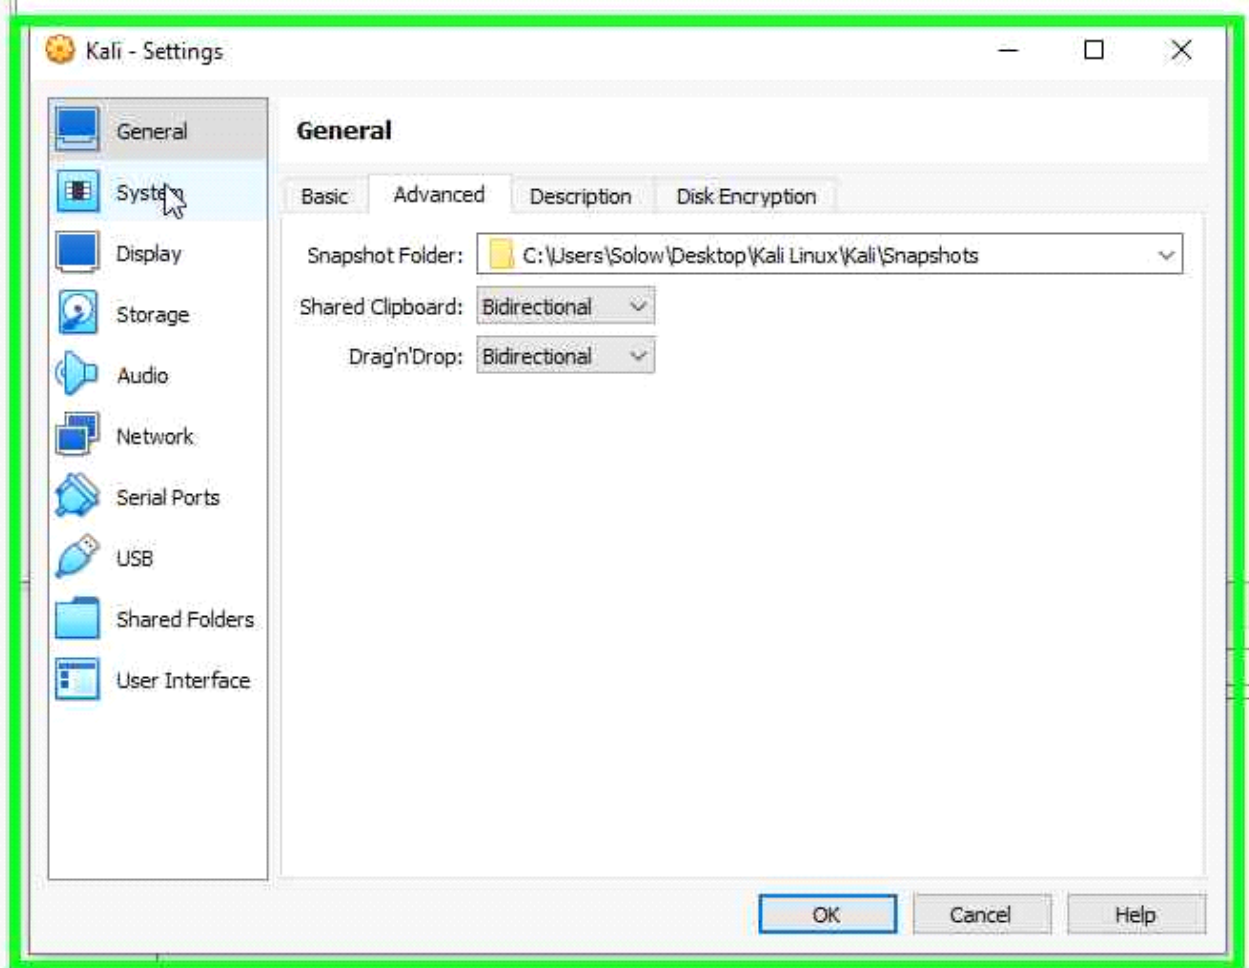

3. Next you want to click on the advanced tab

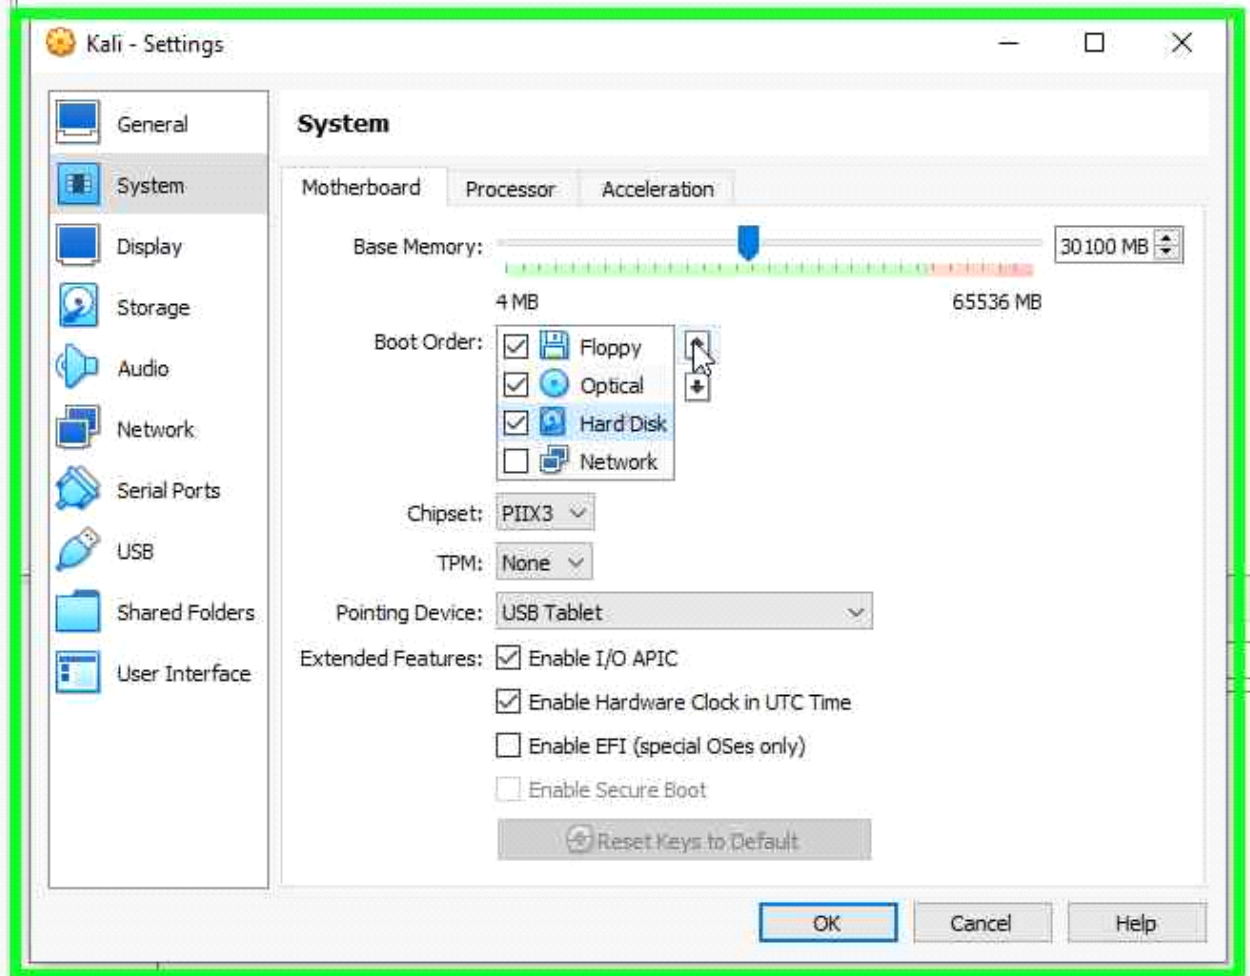

5. Then under Shared Clipboard and Drag'n'Drop you want to click on them and change them both to Bidirectional

6.

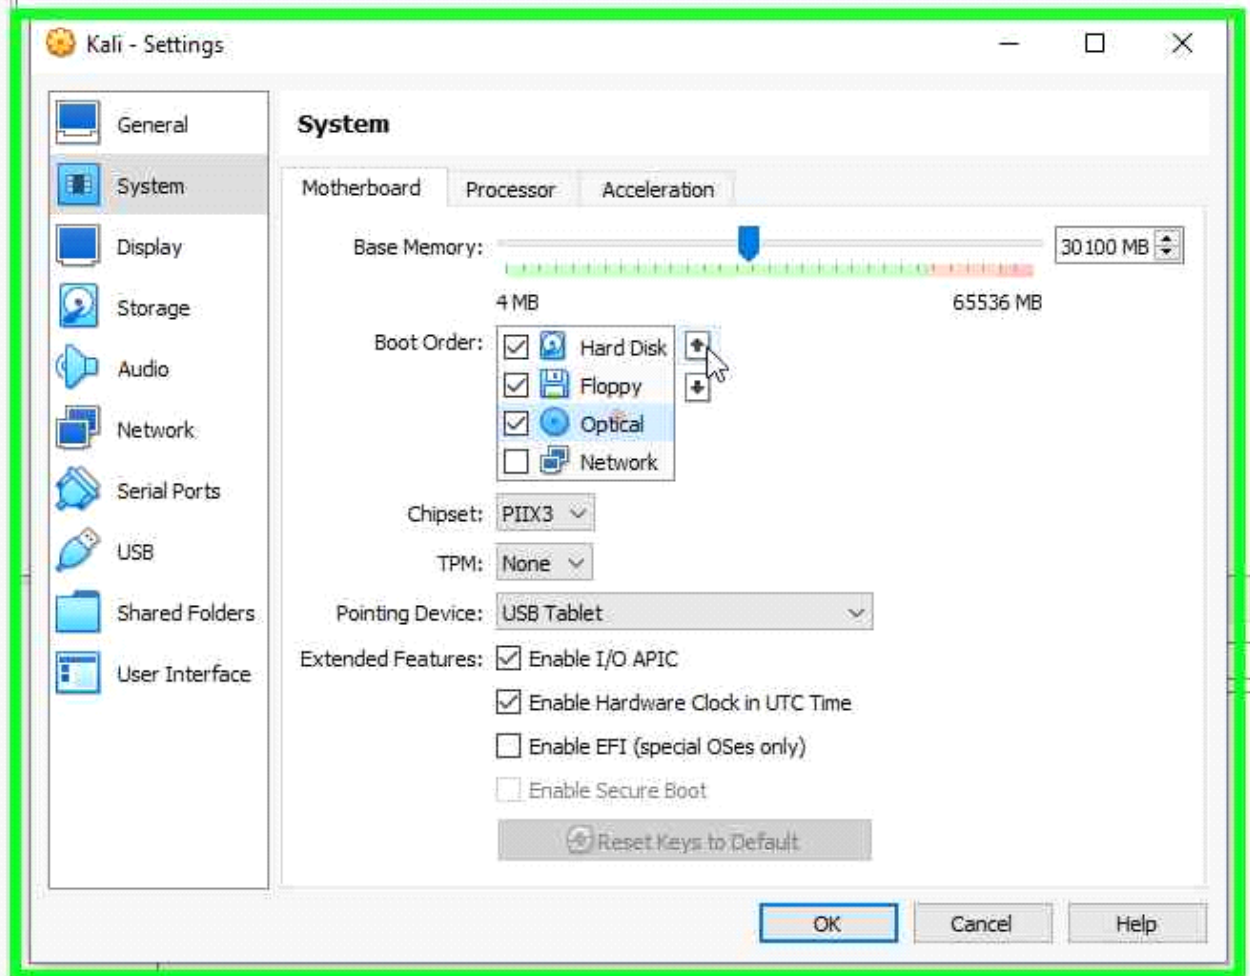

7. Then you want to click on the settings tab as pictured above
8. Here is where you change the boot order of things
9. Select Hard Disk and use the arrows to move it to the top of the order

10.

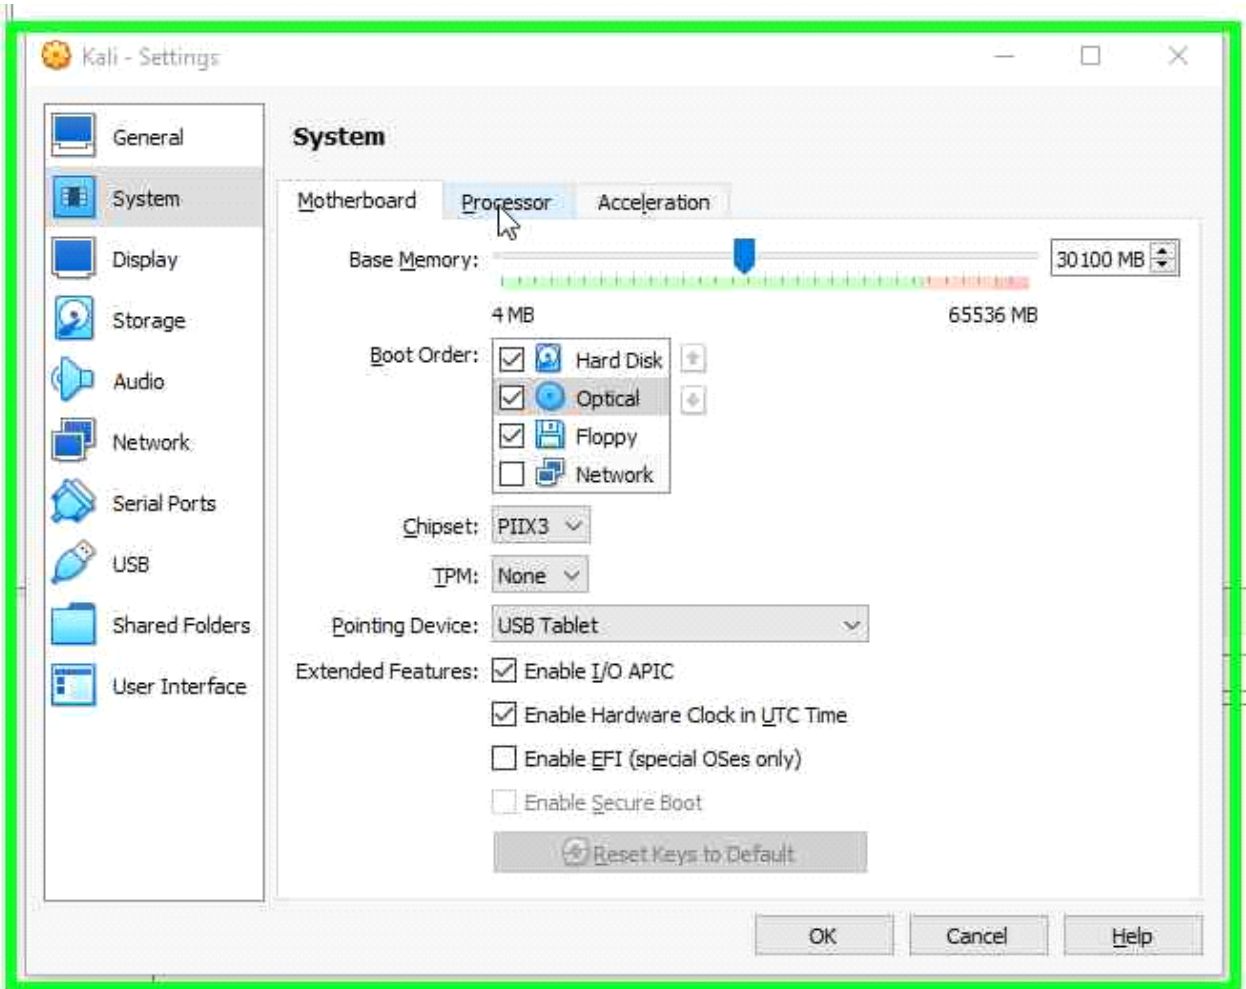

11. Then select the Optical disk and use the arrows to make it number 2 in the order

12.

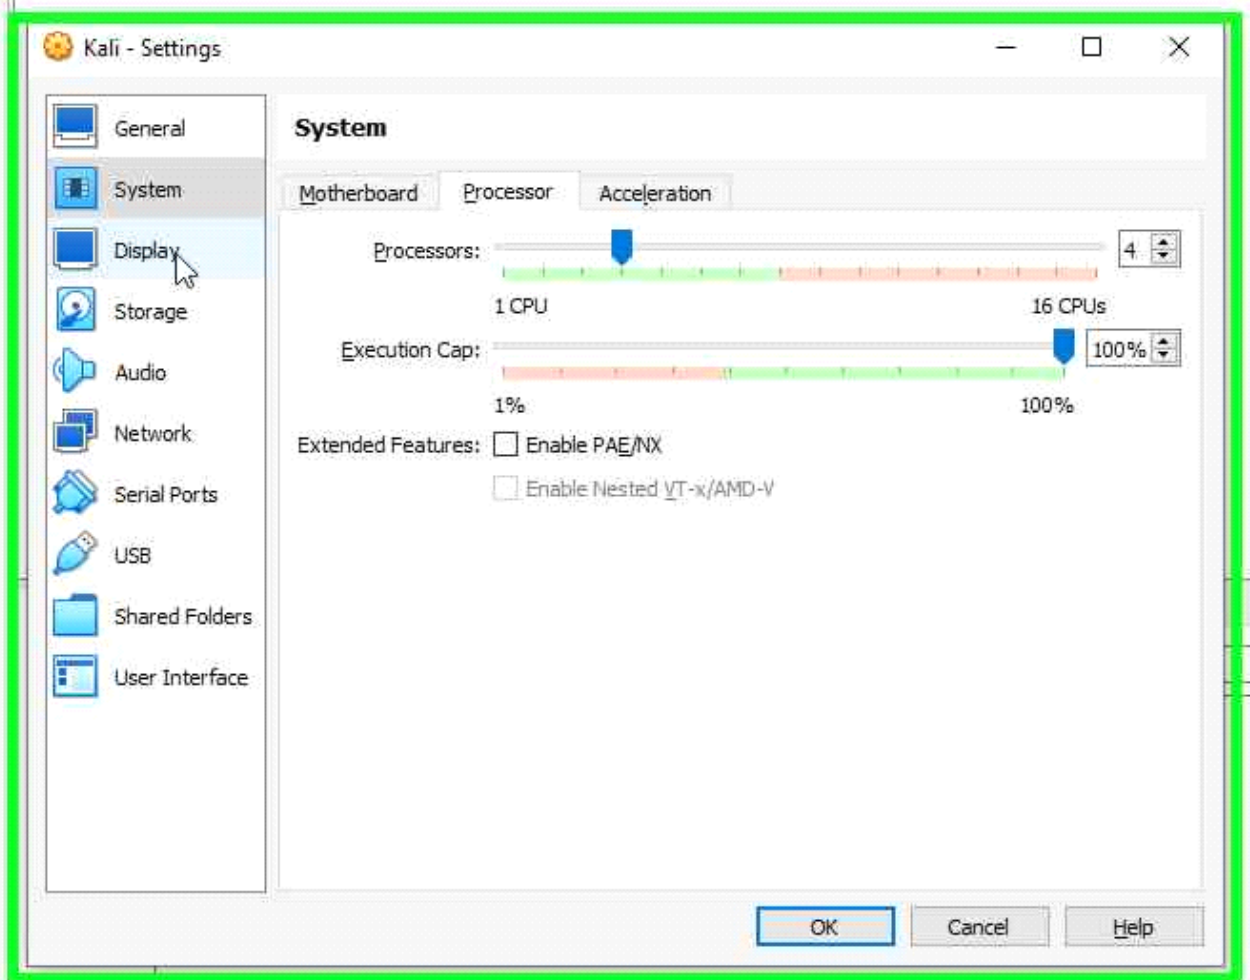

13. Make sure Floppy and Network are disabled by clicking the check mark if it is not already disabled.
14. If you are using a 32 bit system, click on the Processor tab next to the Motherboard tab

15.

16. Make sure that you **ENABLE** by click on the box the "Enable PAE/NX" **ONLY** if you are using a 32 bit system. Leave it off for 64 bit.
17. Next you want to navigate to the Display tab on the left of the screen

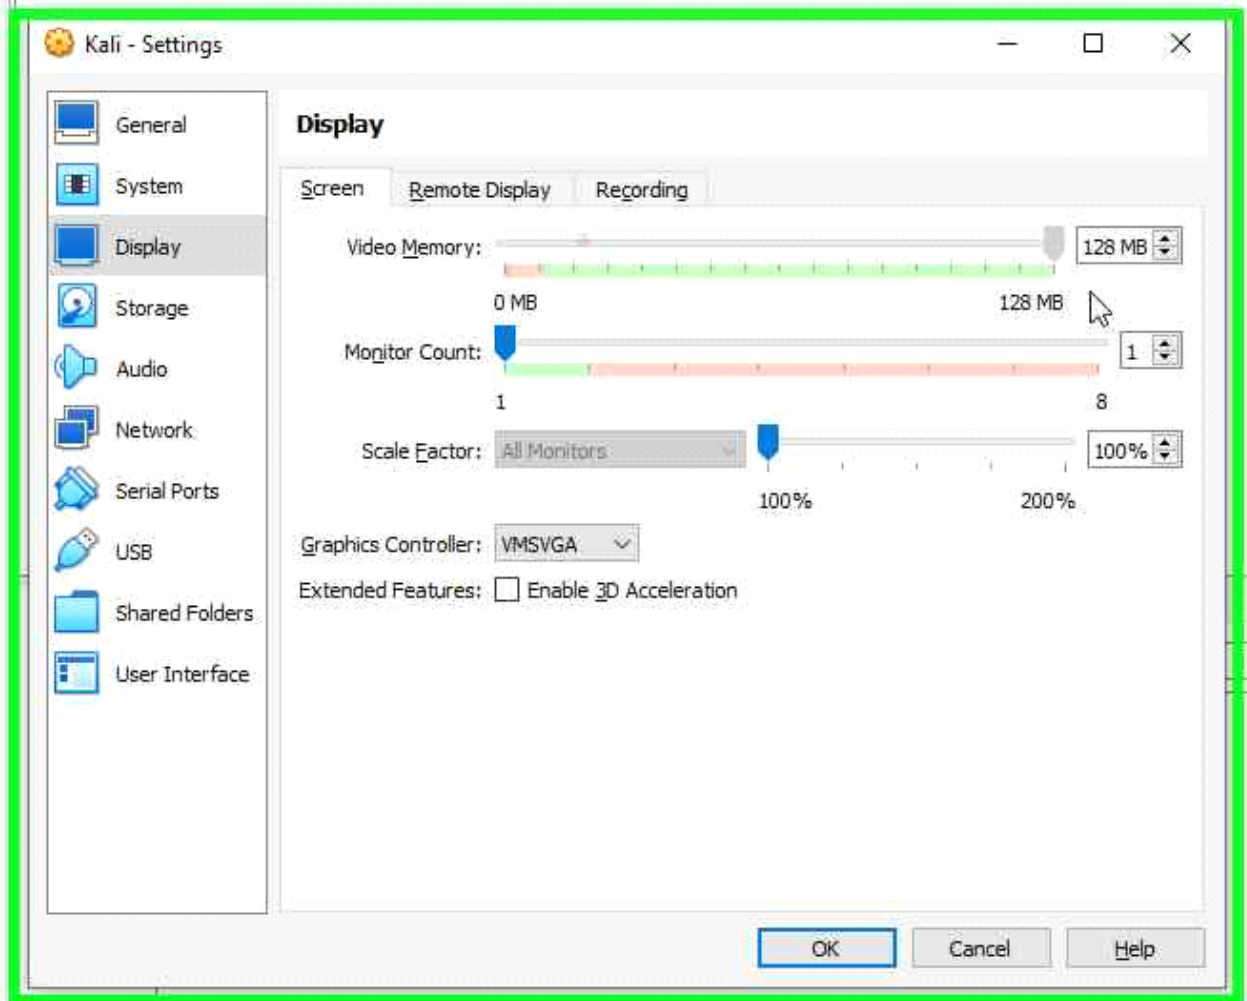

18.

19. Here, you want to make your Video Memory to 128 MB

20.

21. Also make sure the box where Enable 3D Acceleration is unchecked or disabled as it can cause issues.
22. You are now all done with the Advanced Settings and can click on the OK button.
